

PROSPER · ONBOARDING PLAN

Part 1 of 2 — Prerequisites & Onboarding Enablement

Concrete plan to take the platform from its current demo state to onboarding the first real client (e.g. Alemany Capital). Total estimated effort: 7–10 business days of platform work, plus parallel infra/legal actions. This first document covers Phase 0 (blockers) and Phase 1 (onboarding stack).

Phase 0 — Blocking prerequisites (infra + legal · 0 code)

Tasks 0.1 and 0.2 are hard blockers for Phase 2 (real Stellar operation). All others can be paralellised with Phase 1.

#	Acción	Owner	Bloquea / Notas
0.1	Open network egress to the Prosper upstream (lb-backend-develop-*.elb.amazonaws.com)	Infra / platform	Blocks Phase 2
0.2	Confirm production Prosper credentials (PROSPER_API_USER / PROSPER_API_PASS)	Prosper Stellar team	Blocks Phase 2
0.3	Sign contract + DPA with Alemany Capital	Legal	Blocks Phase 3 go-live
0.4	Decide client wallet type (Prosper custodial vs client-owned Stellar address)	Product	Blocks Phase 2.2
0.5	Choose KYC provider: Sumsub or ComplyAdvantage (sandbox API key)	Compliance	Blocks Phase 1.4
0.6	Resend or SendGrid account (API key + verified sending domain)	Platform	Blocks Phase 1.1

KEY DEPENDENCY

Without 0.1 + 0.2 no real transaction can be executed. Everything else can ship in parallel — Phase 1 below does not require the upstream to be open.

Phase 1 — Enable onboarding (3–4 days)

Goal: an external client can **apply, be reviewed and be approved** from scratch, end-to-end.

1.1 Transactional email (Resend)

½ day

- Integrate Resend via `integration_playbook_expert_v2`.
- Create templates: `invite`, `kyc-status-changed`, `approval-needed`.
- Plug into existing POST `/api/users/invite` (today creates the record without sending email).

DoD: Invitation arrives in the client's inbox with a 72-hour signed link.

1.2 Domain allowlist + email→org auto-mapping

½ day

- New table `prosper_email_allowlist` (`org_id` + `domain`).
- In `upsert_user()` during OAuth callback: if domain matches → user attached to the org automatically. Otherwise `status=pending_approval` blocks access.
- UI in Backoffice → UsersAdmin to manage allowlist entries.

DoD: A random Gmail cannot log in; a `@alemany.capital` lands automatically in the right org.

1.3 Public application screen `/apply`

1 day

- New unauthenticated route — corporate form: legal name, country, type, primary contact, expected AUM, description.
- Calls existing POST `/api/onboarding` + uploads the first KYB documents through the existing Documents endpoints.
- Creates a pending user in `org_users` with the applicant's email.

DoD: Alemany completes the form without logging in; the case lands in the Compliance queue in the Backoffice.

1.4 Real KYC provider (Sumsb recommended for LATAM)

1–2 days

- Replace hardcoded pending values for `kyc_status`, `aml_check`, `sanctions_check`, `pep_check`, `travel_rule`.
- Webhook receiver POST `/api/compliance/webhooks/sumsub` updates the case when Sumsub finishes its review.
- Sumsub embedded SDK on `/apply` so the user completes liveness + ID scan in the same flow.

DoD: Document uploaded on `/apply` → Sumsub processes it → status updates by itself in the Compliance queue.

1.5 Document checklist per applicant type

½ day

- Schema: `required_documents` per `applicant_type` (corporate → certificate of incorporation, board resolution, UBO list, proof of address; individual → ID front/back, selfie, utility bill).
- UI in `/apply` renders the checklist with ✓/× until completion.
- Backend validation rejects submission if anything is missing.

DoD: Submission impossible without all required documents present.

PHASE 1 OUTCOME

By the end of Phase 1 a real partner can self-apply through /app`l`y, complete their KYC/KYB digitally, and be reviewed + approved by Prosper's compliance team. No real money moves yet — that happens in Phase 2 (next document).
